

## Providing insight into your Organisation's **operational performance** within the network.

FATHOM is an interactive tool that allows aircraft operators, ANSPs and airports to access comprehensive data on their flights, providing insights into traffic, punctuality, air traffic flow management (ATFM) delay, flight plan event messages, fuel burn and route charges. Thanks to FATHOM, users can quickly determine how their actual performance compares to their planned performance and then make operational adjustments.

Updated daily, **FATHOM** provides an overview of several operational perspectives. User can drill down into **detailed results**, which are always compared to the same period of the previous year. The interactive tool provides **insight** into:

- **Traffic and flow monitoring** : Illustrating how flights are moving around within the network.
- **Excess fuel burn** : Improves sustainability by identifying flights that have the potential to reduce their fuel burn.
- **Punctuality results** : Supports flight efficiency through improved understanding of on-time performance.
- **ATFM regulations** : showing users which regulations affected their flights and the attributed ATFM delay.
- **Flight plan event messages** : allowing users to gain insight into the event that are positively or negatively influencing their flight metrics.
- **Sector configuration** : enabling aircraft operators to understand better an Area Control Centre's ability to manage the demand based on the available capacity at a specific time.

*“As the aviation sector strives to decarbonise, operational adjustments to improve efficiency and sustainability have a key role to play, as they can be implemented fairly quickly and at a relatively low cost.”*

Guy Hawson  
Operational Performance Expert (Eurocontrol)
